), Lambda 2ap II"
/note="Vector: pBluescript II SK-; Site_l: EcoRI; Site_2:
XhoI; Stress condition II library, constructed by John
Davies and Jeffrey McDermott, combines cDNAs from Cc-1690
cells grown to mid-log phase in TAP (NH4+ - containing)
and shifted to TAP - NO3* (2Afrs); H2 production
conditions (0, 12hr, 24hr) see Melis et al.,(2000) Plant
Phys. 122: 127-135; TAP + H202 (1, 12, 24 hr); TAP +
sorbitol (1, 2, 6, 24 hr); TAP + Containing)
sorbitol (1, 2, 6, 24 hr); TAP + Containing)
sorbitol (1, 2, 6, 24 hr); TAP + Containing)
sorbitol (1, 2, 6, 24 hr); TAP + Containing)
sorbitol (1, 2, 6, 24 hr); TAP + Containing and shifted from each sample, pooled and cDNA
synthesized. The cDNA was directionally cloned into lambda
Zap II (Stratagene) in the EcoRI (5) and XhoR (3)
sites: pBluescript II SK- plasmids were excised from the
lambda ZAP clones by superinfection with ExAssist
(Stratagene) phage. The library was normalized using
method 4 described in Bonaldo et al., (1996) Genome
Research 6: 791-806."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N.                             fragment is 1 of 24 roob gene fragments (AAS05201-AAS05224) from
fragment is 1 of 24 roob gene fragments (AAS05201-AAS05224) from
various Mycobacterial species. These roops gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
polymorphism (RPLP) pattern of the 24 roob gene fragments: isolating,
amplifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the Known rpob gene
fragments with the unidentified fragment. The roob gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTM) encountered in subjects infected
with human immunodeficiency virus (HTV). Analysis of the roob gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
tests. Also described are oligonuclectide probes (AAS05227-AAS05242) for
detecting specific Mycobacterial species.

The present sequence for Mycobacterium gordonae type III rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used to the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene frequired), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical dates in a society of a particular disconding procies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIV; PRA; RFLP;

                                                                                                                                                                                                                                                         The present sequence for Mycobacterium avium rpoB gene
fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO524) from
various Mycobacterial species. These rpoB gene fragments can be used
to the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
colymorphism (RFLP) pattern of the 24 rpoB gene fragments isolating,
amplifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
fragment of appropriate therapies, including M. tuberculosis, M. leprae
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTM) encountered in subjects infected
with human immunodeficiency virus (HTW). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual blochemical
tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

tragment is 1 of 24 rpob gene fragments (AASO5201-AASO524) from various Mycobacterial species. These rpob gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel pCR-restriction fragment length polymorphism species using a movel pCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism analysis (PRA) method comparises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpob gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpob gene fragments with the unidentified fragment. The rpob gene fragments for useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprac and non-tuberculous mycobacteria (NTW). Analysis of the rpob gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 GCCTGCACGTCGGCGATCCCATCACCACGCTGACCGAGGAAGACGTCGTCGCCA 120

frep present sequence for Mycobacterium marinum rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RRLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RRLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species. Gor diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTW). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present sequence for Mycobacterium gordonae type IV rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments

C fragments with the unidentified fragment. The rpoB gene fragments

are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate theraptes, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene frequired), and can differentiate between many species in a single required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical archive machine experience.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ä

                                                                                                 ò
                                                                                                                                 셤
                                                                                                                                                                                                                                                                       method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments or comparing a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate theraples, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 pcR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical to the standard of described are oligonucleotide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ő

These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA)

The present sequence for Mycobacterium fortultum rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the Known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identified and comparing the RFLP patterns from the Known rpoB gene are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene frequired), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical abstract in an encountered are oligonuclectide probes (AAS05227-AAS05242) for abstract in a shorter in a second and an additional and an additional and an additional are oligonuclectide probes (AAS05227-AAS05242) for abstract in a second and additional additional additional and additional and additional additional and additional additional and additional a

Tragment is 1 of 24 rpoB gene fragments (AAS05201-AAS0524) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism analysis (PRA) pattern of the 24 rpoB gene fragment; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RELP patterns from the microorganism to be identified and comparing the RELP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments with the unidentified fragment. The rpoB gene fragments or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and onstuberculosus mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV) Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HIV; PRA; RFLP;

The present sequence for Mycobacterium kansasii rpoB gene
fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method romerises obtaining a restriction fragment length
polymorphism (RFLP) pattern of the 24 rpoB gene fragments isolating,
amplifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTM) encountered in subjects infected
with human immunodeficiency virus (HIV). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR

                                                                                                      ö
required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence for Mycobacterium tuberculosis rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism (FRLP) pattern of the 24 rpoB gene fragment; isolating, polymorphism (FRLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments

are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonuclectide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

Claim 1; Page 45; 50pp; English.

```
novel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
amplifying and digesting the DNA fragment from the microorganism to
fragments with the unidentified fragment. The rpoB gene fragments
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (MTM) encountered in subjects infected
with human immunodeficiency virus (HIV). Analysis of the rpoB gene
fragments is raphd, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual blochemical
                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

The present sequence for Mycobacterium bovis rpoB gene
fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
in the diagnosis and identification of Mycobacterium species using a
novel pCR-restriction fragment length polymorphism analysis (PRA)

method. The method comprises obtaining a restriction fragment length

complifying and dispering the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the microorganism to
be identified and comparing the RFLP patterns from the known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
are useful to identify a wide range of Mycobacterium species, e.g. for
clasmosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTW) encountered in subjects infected
with human immunodeficiency virus (HIV). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
comparison of appropriate difficult to distinguish by usual blochemical
tests. Also described are oligouncleotide probes (AAS05227-AAS05242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Non-tuberculous mycobacteria; rpoB gene fragment; NTM; H1V; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

        The present sequence for Mycobacterium celatum rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) can ethod. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments

Tragments with the unidentified fragment. The rpoB gene fragments

are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemhological and pathogenesis information for selection of appropriate therapies, including N. tuberculosis, M. leprae and non-tuberculous mycobacteria (NFW) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical cests.
                                                                                                                                                                                                                                                                                                                                                                                                                                   0;

                                                                      This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise a nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 GCCTGCACGTCGGCGATCCGATCACCAGCTCCACGCTGACCGAGGAAGACGTCGTCGCCA 120

Mycobacterium tuberculosis partial rpoB gene for RNA polymerase beta subunit, isolate 1255-98.
AJ318816. G1:22208408
RNA polymerase beta subunit; rpoB gene.
Mycobacterium tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Herrera,L., Jimenez,M.S. and Saez,J.A.
Molecular analysis of rifampin-resistant Mycobacterium tuberculosis
isolated in Spain (1996-2001). Description of new alleles into rpos
gene and review
                                                      ö

Mycobacterium; Mycobacterineae; Mycobacteriaceae;
I (bases I to 334)

Bergeron, M.G., Boissinot, M., Huletsky, A., m Nard, C., Ouellette, M.,
Picard, F.J. and Roy, P.H.

Highly conserved genes and their use to generate probes and primers
for detection of microorganisms
Patent: WO 0123604-A 2072 05-APR-2001;
Infectio Diagnostic (I.D.I.) INC. (CA)

Location/Qualifiers
